Package 'worldbank'

October 22, 2026

Title Worldbank Financial Indicators

Version 0.0.0.9000

Author Dimitrios Zacharatos [aut, cre]

Maintainer Dimitrios Zacharatos <dzacharatos@yahoo.com>

Depends R (>= 3.5.0), shiny, magrittr

Imports DT, dplyr, plotly

Description
Visualization of descriptive statistics of financial indicators provided by World Bank organization.

License GPL-3

Contents

country_code 2
mfi 2
mfi_population 3
worldbank 4

Index **6**

country_code *Country Metadata (WDI Country Codes)*

Description

Country-level metadata and classification fields from the World Bank country codes table.

Usage

```
country_code
```

Format

A data frame with one row per country/region code:

Country Code 3-letter World Bank / ISO-like country code

Short Name Short country name used in visualizations

Table Name Country name as shown in WDI tables

Long Name Official long country name

2-alpha code 2-letter country code

Region World Bank regional classification

Income Group World Bank income-group classification

... Additional source metadata columns from `WDICountry.csv`

Details

This dataset is used to enrich and classify country-level observations in app visualizations.

World Bank Open Data via worldbank.org

mfi *World Bank Indicators Dataset*

Description

A cleaned dataset of key indicators from the World Bank for various countries across years.

Usage

```
mfi
```

Format

A data frame with one row per country-year-indicator combination:

Country Code 3-letter ISO country code (e.g., "ABW" for Aruba)

Country Name Full country name (e.g., "Aruba")

Indicator Name The name of the World Bank indicator (e.g., "School enrollment, primary, female (% gross)")

Year Observation year

value Numeric value for the indicator in that country and year

Details

This dataset supports multiple development indicators (social, economic, demographic), covering multiple years and countries. It is used across various tabs in the World Bank Shiny app for data visualization.

---

mfi_population *Age-Sex Specific Population Percentages*

Description

A dataset containing age- and sex-specific population percentages for countries, based on World Bank data. Useful for creating population pyramids and analyzing demographic structures.

Usage

```
mfi_population
```

Format

A data frame with one row per country-year-age-sex group:

Country Name Full country name (e.g., "Aruba")

Indicator Name The full indicator name (e.g., "Population ages 65-69, female (% of female population)")

Year Observation year

value Percentage of population in the specified age-sex group

age Age group (e.g., "65-69", "70-74")

unit Unit of measurement ("Percent" or "Frequency")

sex Sex of the population group ("Female", "Male", or "Total")

Details

This dataset focuses on the percentage distribution of male and female populations across 5-year age groups. It is suitable for demographic visualizations such as population pyramids.

`worldbank` *Launch World Bank Data Shiny App*

Description

Initializes and launches a Shiny application for visualizing World Bank data. The app includes dynamic Plotly charts for comparing countries, indicators, and demographic statistics across time.

Usage

```
worldbank()
```

Details

This function:

- Loads required datasets: `mfi`, `country_code`, and `mfi_population`.
- Builds `mfi_cor` on the fly from selected indicators in `mfi`.
- Sets formatting options for numbers and fonts.
- Defines a helper function `format_bignum` for human-readable large numbers (e.g., K, M, Bn, Tn).
- Launches the Shiny app using `shinyApp(ui = ui, server = server)`.

The Shiny app interface includes:

Country Comparison Compare a selected indicator across countries.

Indicator Comparison Compare multiple indicators for one country.

Population Pyramid Visualize male/female population distribution.

Barplot Rank countries by a selected indicator.

Scatterplot Show relationship between two indicators.

Map Animated choropleth map by year.

Index Tabular view of the dataset.

Value

A running Shiny app in the default web browser.

Note

Ensure that the datasets `mfi`, `country_code`, and `mfi_population` are available in your environment or loaded via a package before calling this function.

Examples

```
# worldbank()
```
